

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE

Bonds and similar securities are at the present time bought and sold in such large quantities and at such narrow margins of profit that the ordinary tables are found entirely inadequate, giving, as they do, accurate values only as high as \$100. For example, the value of \$1,000,000 5% bonds for ninety years to yield a net income of 2.96% is, on the authority of one of the ordinary tables, . . . \$1,640,620.00 while the accurate value, as given in this book, is . . . 1,640,227.41 a difference of \$392.59 which is certainly too great a loss for the buyer to submit to. I have therefore undertaken and carried out the great work of computing these values to eight places of decimals. In order to assure the exactness of the last figure not merely within a cent but to the nearest cent, and to furnish periodical tests, it was necessary to carry all the results to twelve places and the basis-figures for each rate to 18. This was done by the use of PETER GRAY'S and STEINHAUSER'S tables of extended logarithms. All the results have been tested in several ways by additions and differences and are believed to be correct.

Besides their use in dealing in bonds, I believe that these tables will be especially useful to trustees and corporations who wish to keep their investment accounts by the scientific method, writing off premiums and writing up discounts progressively so as accurately to distinguish the true income from re-payments of capital.

EXPLANATION.

Bonds and other securities payable at a future date are frequently bought and sold above par, at a premium, or below par, at a discount

When this is the case, the net income actually realized on the investment differs from the cash interest received. If above par, the net income is less than the cash interest, and the difference goes to reduce gradually the amount invested so that at the date of maturity, the value is reduced to par by amortisation; while if below par the value is gradually advanced by accumulation until it reaches par at maturity.

The object of these tables is to find the price at which a bond will yield a certain annual income receivable semi-annually, or the approximate rate of income which it will yield at a certain price.

Let it be required to find at what price one must purchase \$1,000,000 of 3% bonds so as to produce a net income of 2.50%, the bonds maturing in 1½ years. We look in the table for 3%, page 1, in the column headed 1½ years and find opposite 2.50 the figures \$1,007,316.33; this is the required price.

The cash-interest is \$15,000 each half-year. The net income for the first half-year is 1.25% of \$1,007,316.33 or \$12,591.46. The difference \$2,408.54 is applicable to amortisation or the re-payment of premium. Subtracting this amortisation from the original price, we have \$1,004,907.79 as the amount now invested, and this is proved correct by the column headed "1 year." For the second half-year, we proceed in the same way; cash interest, \$15,000.00; net income (1.25% of \$1,004,907.79) \$12,561.35; amortisation, \$2,438.65; resulting investment value \$1,002,469.14, as shown by the table for ½ year. Finally the same process exactly wipes out the premium \$2,469.14, leaving the bond at \$1,000,000. Any of the values in this book may be tested by this method.

It is evident that the figures in the table may be read as \$1, \$10, \$100, \$1000, \$10,000 or \$100,000 by placing the decimal point accordingly and that by multiplication any principal may be valued.

BROKEN TIMES.

It frequently happens that bonds are sold at a date between the interest days. The price may then be stated in either of two

ways; "flat" or "and interest." The former price includes the accrued interest since the last period; the latter is exclusive of the interest.

It is the established custom to compute net income and amortisation for a less period than a half-year at simple interest. The initial investment-value is maintained unchanged as a basis, and the net income for each day is considered one 180th of the half-year's income. The amortisation or accumulation for each day is likewise one 180th of the half-year's amortisation or accumulation.

To ascertain the 'flat' price, add to the initial value such a fraction of the half-yearly net income as the time elapsed is of the half-year. To ascertain the price "and interest" first take the difference between the two nearest values in the table; this will be the half-year's amortisation or accumulation. Of this take the appropriate fraction according to the time elapsed and subtract it if the bond is above par, but add it if below.

For example: required the value of a 3% bond for \$1,000,000 having 1 year, 4 months, 15 days to run, to yield 2.50% net income.

At $1\frac{1}{4}$ years the value is \$1,007,316.33

The income thereon at 2.50%

for the half year is \$12,591.46

As 6 month 15 days have elapsed,

being $\frac{1}{4}$ of 6 months, we take $\frac{1}{4}$ of 12,591.46 3,147.87

which added to the initial value gives \$1,010,464.20 flat.

To find the price "and interest"; from .. \$1,007,316.33

subtract the value at one year 1,004,907.79

Half-year's amortisation 2,408.54

of which one-quarter is 602.13

which subtracted from 1,007,316.33

gives \$1,006,714.20 and interest.

The accrued interest for 1 month, 15 days is 3,750.00

which proves the above value. \$1,010,464.20 flat.

When the total time is less than six months, the above method, which is not strictly equitable, is often abandoned and the value ob-

tained by the process of discounting. Take as a dividend the entire sum, both principal and interest, which will be paid at maturity; take as a divisor \$1.00 plus interest on \$1.00 for the unelapsed time at the income rate. Thus, to find the value of the same bond having only one month, fifteen days to run, the entire amount collectable is \$1,015,000.00. Divide this by 1.003,125 and you have as the discount value, \$1,011,838.01
 This with interest for 1½ months at 2.50% per annum 3,161.99
 amounts to \$1,015,000.00

A table for computing accrued interest at various rates, up to six months, is given on page 121, at the beginning of the colored pages.

INTERMEDIATE RATES.

The rates given in the body of the book are 51 in number: 2.50, 2.55, 2.60, 2.65, and so on to and including 5%. But the intermediate rates 2.51, 2.52, 2.53, 2.54, 2.56, 2.57, 2.58, 2.59, can also be obtained accurately, something never before attained in any publication. There are thus 251 separate rates of income which may be ascertained

The intermediate rates are calculated by the use of the colored pages at the end of the book, pages 124 to 183.

According to rules given on page 123, certain differences are to be subtracted from the rough approximations obtained in the usual way by cutting up the interval between two values into five equal parts.

This method is original and hitherto unpublished. It gives results varying not more than two cents from the nearest cent and in the vast majority of cases exactly agreeing with the figures as calculated by logarithms.

OTHER BONDS.

Values for bonds at other rates of cash interest than those here given may also be obtained from the tables. By taking one income rate for a certain number of years, it will be found that the difference between the value of a 3% and of a 4% bond is exactly the same as that between a 4% and a 5%, or a 5% and a 6%, or a 6% and a 7%. Hence to apply the tables to an 8% bond, we add the standard difference to the value for a 7% bond; for a 2% bond we subtract the same

difference from the 3%. For a $7\frac{1}{2}\%$ or a $2\frac{1}{2}\%$ bond, we add or subtract one-half the difference. For a 3.65% bond, we add to the 3% $\frac{65-100}{100}$ of the difference.

ANNUITIES.

These tables may be used also as annuity tables. The premium is the present worth of an annuity consisting of the **extra interest**. Take for example a 3% bond, 50 years, net 2.65%. The cash interest is \$30,000 per annum, while at 2.65% it would be \$26,500. The holder of the bond enjoys an annuity of \$3,500, for which he must pay; the premium \$96,662.62 is the present worth of an annuity of \$3,500 payable semi-annually discounted at 2.65% compounded semi-annually. The present value of a similar annuity of \$1. is $96,662.62 \div 3,500 = 27.61789$. 2.65% of this, or .73187412, is the compound discount of a single dollar for 50 years, and by subtracting this from \$1. we have .26812588 for the present worth of a single dollar.

DOUBLING THE TIME.

A method newly discovered by the author, enables us to utilize this compound discount of \$1. so as to double the number of years embraced in the table. Subtracting the compound discount from 2, gives a multiplier which will transform a 50 year premium into a 100 year premium, or double the time in any case.

$$2 - .73187412 = 1.26812588;$$

$96,662.62 \times 1.26812588 = 122,580.37$; and the tabular value at 100 years is \$1,122,580.37. To expand this again to 200 years; $122,580.37 \div 3500 \times .0265 = .92810852$; $2 - .92810852 = 1.07189148$; $122,580.37 \times 1.07189148 = 131,392.85$ which is the premium at 200 years.

QUARTERLY BONDS.

As the interest on the large majority of bonds is payable half-yearly, all the calculations in these tables are made on the half-yearly basis. The table on page 184 shows how much value is added to a bond by the fact of quarterly conversion. It gives a series of multipliers--

decimal fractions by which the premium or discount is to be multiplied in order to give the increment added to the value of the bond by the quarterly feature. At the resulting price the quarterly bond will pay an effective income equivalent to that of a semi-annual bond.

Thus a $3\frac{1}{2}\%$ bond, 35 years, for \$1,000,000 yielding 2.50% income is worth \$1,232,348.38; the premium is \$232,348.38. On page 184, line 2.50, we find the multiplier .0109035, by which we multiply \$232,348.38, giving \$2,533.41 as the additional value for quarterly interest. This added to \$1,232,348.38, gives \$1,234,881.79 as the value of a quarterly bond yielding an income equivalent to 2.50% semi-annually.

If the bond is below par, the discount is multiplied by the multiplier in the same way and the result added to the value of the bond.

The entire theory of the valuation of Bonds is fully explained by arithmetic in the author's book entitled "THE ACCOUNTANCY OF INVESTMENT," which also illustrates the practical working of bond accounts kept on the amortisation plan.

INTERMEDIATE RATES.

In the foregoing tables the rates of income are five one-hundredths of one per cent. apart; 2.50, 2.55, 2.60, 2.65, etc. The following pages will make it easy to compute the four intermediate rates, as 2.51, 2.52, 2.53 and 2.54, 2.56, 2.57, 2.58 and 2.59. No previous tables give these results with accuracy.

The first step is to get an approximate value by dividing the difference. The difference between two successive lines of the main tables is divided by 5; then subtracting $\frac{1}{5}$, $\frac{2}{5}$, $\frac{3}{5}$ or $\frac{4}{5}$, we get an approximate value for any of the rates ending in 1, 2, 3 and 4, or in 6, 7, 8 and 9.

Thus, for a 5% bond, 50 years, the difference between values at 2.50 and 2.55 is \$21,127.87; $\frac{1}{5}$ thereof is \$4,225.574 and the approximate value for 2.51, \$1,707,041.17; for 2.52, \$1,702,815.59; for 2.53, \$1,698,590.02, for 2.54, \$1,694,364.44. Similarly by "splitting" the difference between 2.55 and 2.60 we have the four approximations; 2.56, \$1,685,989.65; 2.57, \$1,681,840.43; 2.58, \$1,677,691.20; 2.59, \$1,673,541.98.

All these approximations are too large and must be corrected by subtracting at least once the difference in the table under 50 years, page 172. We there find \$30.93 and \$30.28 opposite 2.50 and 2.55; these are the differences and \$0.65 is the subdifference.

To correct 2.51 or 2.56, or any rate with the terminal 1 or 6, simply subtract the difference. Therefore the true value of 2.51 is $\$1,707,041.17 - \$30.93 = \$1,707,010.24$; that of 2.56 is $\$1,685,989.65 - \$30.28 = \$1,685,959.37$.

To correct any terminal 2 or 7: subtract $1\frac{1}{2}$ times the difference and then add $\frac{1}{10}$ the sub-difference. For 2.52, $1\frac{1}{2}$ times \$30.93 is \$46.39; $\frac{1}{10}$ of 65 cents is 6 cents; $\$1,702,815.59 - \$46.39 + \$0.06 = \$1,702,769.20$ is the true value. For 2.57, using the difference 30.28 and the sub-difference .63, we get \$1,681,795.07. The nearest result obtainable from ordinary tables is \$1,681,970.

For terminals 3 or 8, subtract again $1\frac{1}{2}$ times the difference, but add $1/5$ the sub-difference. This gives for 2.53, \$1,698,543.76 and for 2.58, \$1,677,645.91.

For terminals 4 or 9, subtract the difference itself and add $1/5$ the sub-difference.

The rules may be summarized as follows:

1st Step. Approximate by dividing the difference in the main tables by 5.

2nd Step. For 1, 4, 6 or 9, subtract the tabular difference; for 2, 3, 7 or 8 subtract $1\frac{1}{2}$ times the tabular difference.

3rd Step. If necessary, for 2 or 7 add $1/10$ of the sub-difference, for 3, 4, 8 or 9 add $1/5$ of the sub-difference.

THE ASTERISK (*) means that in halving the tabular difference, a $\frac{1}{2}$ cent must be added; without the asterisk a $\frac{1}{2}$ cent must be rejected. Thus, $1\frac{1}{2}$ times 10 05 (without the asterisk) is 15 07; $1\frac{1}{2}$ times 10*05 is 15 08.

The third step is made to the nearest cent, the mills being taken into account. When the time is short or the principal small, there is no third step.
